Uncertain Genotype

Q

probability distribution

$q(x)$

R

$r(x)$

S

$s(x)$

Match Likelihood Ratio

Q

$\Pr(Q=S)$

S

$\Pr(Q=R)$

R

$$LR = \frac{\Pr(Q=S)}{\Pr(Q=R)}$$

Interpreting DNA Evidence

- A. Obtain DNA data
- B. Infer genotype
 - 1. Data
 - 2. Model
 - 3. Compare
 - 4. Probability
- C. Likelihood ratio

Genotype Inference

- 1. Data
 - evidence
 - victim
- 2. Model
 - genotype candidate
 - generate pattern
- 3. Compare
 - likelihood function (bell curve)
 - product rule for data
- 4. Probability
 - genotype probability distribution
 - genotype probability = $\frac{\text{genotype likelihood}^*}{\text{sum of all genotype likelihoods}^*}$

Different Methods: Data Used

Data Used	<u>inclusion</u>	<u>subtraction</u>	<u>addition</u>
victim profile	NO	YES	YES
original data	NO	NO	YES

Statistical Inference View

inclusion method vs. likelihood ratio approach

"often robs the items of any probative value" - B. Weir

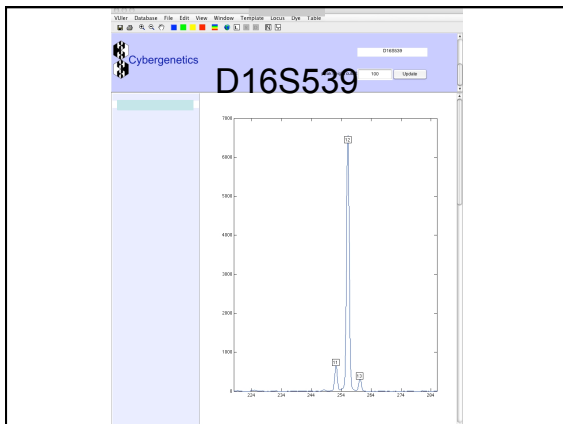

"usually discards a lot of information compared to the correct likelihood ratio approach" - C. Brenner

"does not use as much of the information included in the data as the LR approach but, conceptually, they are equivalent" - M. Krawczak

"Recommendation 1: The likelihood ratio is the preferred approach to mixture interpretation." - DNA commission of the International Society of Forensic Genetics

Mixture Case

- DNA from under victim's fingernails
- two contributors to DNA mixture
- 93.3% victim & 6.7% unknown
- 2 ng DNA in 50 ul
- ProfilerPlus + Cofiler STR analysis
- three different mixture interpretations
 1. inclusion
 2. subtraction
 3. addition

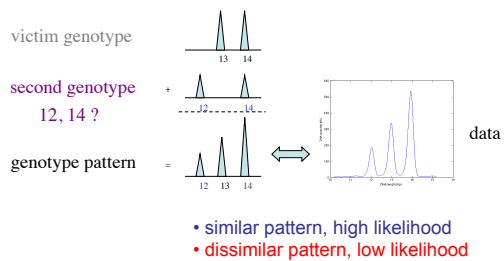

Inclusion Method

'Inclusion' LR at D16S539

Genotype Probability Distributions				Match Probabilities	
allele pair	Q q(x)	R r(x)	S s(x)	Pr(Q=S) q(x)*s(x)	Pr(Q=R) q(x)*r(x)
11 11	0.16667	0.07413			0.01236
11 12	0.16667	0.18466			0.03078
11 13	0.16667	0.08896	1	0.16667	0.01483
12 12	0.16667	0.11499			0.01917
12 13	0.16667	0.11080			0.01847
13 13	0.16667	0.02669			0.00445
				Pr(Q=S) Pr(Q=R)	0.16667 0.10004
				Likelihood Ratio	1.666

Addition Method

'Addition' LR at D16S539

allele pair	Genotype Probability Distributions			Match Probabilities	
	Q q(x)	R r(x)	S s(x)	Pr(Q=S) q(x)*s(x)	Pr(Q=R) q(x)*r(x)
11 11		0.07413			
11 12		0.18466			
11 13	0.722	0.08896	1	0.72200	0.06423
12 12		0.11499			
12 13	0.028	0.11080			0.00310
13 13	0.250	0.02669			0.00667
				Pr(Q=S) 0.72200	
				Pr(Q=R) 0.07400	
				Likelihood Ratio 9.756

Conclusions: MLR

- a useful tool for determining identification information with uncertain genotypes
- works well on forensic mixture cases
- enables quantitative validation, calibration, and comparison of genotype inference methods
- based on generally accepted scientific principles
